

## **DAX Measures Documentation**

### **National Retail Company: Business Intelligence & Interactive Dashboard Development**

**Prepared for:** AnalystLab Africa Consulting

**Date:** 19 August 2026

**Prepared by:** Poloko Dignity Ranna, Junior Data Analyst

#### **Total Sales**

Calculates the total revenue generated from all orders.

Dax formula: Total Sales = SUM('SampleSuperstore'[Sales])

#### **Total Profit**

Calculates the net profit from all orders

Dax formula: Total Profit = SUM('SampleSuperstore'[Profit])

#### **Profit Margin**

Calculates the percentage of profit relative to total sales

Dax formula: Profit Margin = DIVIDE ([Total Profit], [Total Sales])

#### **Sales - Previous Year (Time Intelligence)**

Calculates the total sales for the exact same period in the previous year. Requires the continuous DateTable connected to SampleSuperstore [Order Date]

Dax formula: Sales\_LY = CALCULATE(SUM('SampleSuperstore'[Sales]), SAMEPERIODLASTYEAR('DateTable'[Date]))

#### **Sales Growth Percentage (Year-over-Year)**

Calculates the percentage increase or decrease in sales compared to the previous year

Dax formula:

Sales\_Growth\_Percentage = IF(ISBLANK([Sales\_LY]), BLANK (), DIVIDE(SUM('SampleSuperstore'[Sales]) - [Sales\_LY], [Sales\_LY]))

#### **Revenue Lost to Discount**

Calculates the total monetary value given away as discounts to customers. This is a high-impact KPI for the Executive Dashboard.

Dax formula:

Revenue Lost to Discount = SUMX ('SampleSuperstore', 'SampleSuperstore'[Sales] \* 'SampleSuperstore'[Discount])

### **Profit per Order**

Calculates the average profit generated per distinct Order ID, used to measure operational efficiency.

Dax formula:

Profit per Order = DIVIDE ([Total Profit], DISTINCTCOUNT ('SampleSuperstore'[Order ID]))

### **Order Volume**

Calculates the total number of unique orders placed, used to measure customer activity and transaction volume.

Dax measure: Order Volume = DISTINCTCOUNT ('SampleSuperstore'[Order ID])

### **Top Customer profit**

Identifies the highest profit amount generated by a single customer, used to measure maximum customer profitability and benchmark VIP performance.

Dax measure: Top Customer Profit = MAXX (VALUES (SampleSuperstore [Customer Name]), [Total Profit])

### **Top customer sales**

Identifies the highest sales amount generated by a single customer, used to measure maximum customer revenue and identify revenue concentration risk.

Dax measure: Top Customer Sale = MAXX (VALUES (SampleSuperstore [Customer Name]), [Total Sales])

### **Products Making Loss**

Counts the total number of product line items that generated negative profit, used to identify the scale of unprofitable products and monitor improvement over time.

Dax formula:

Count Loss Products = CALCULATE(COUNTROWS('SampleSuperstore'), FILTER ('SampleSuperstore', 'SampleSuperstore'[Profit] < 0))
